Array Package Documentation

This package provides array manipulation utilities for MoonBit, including fixed-size arrays (FixedArray), dynamic arrays (Array), and array views (ArrayVie w/View).

Creating Arrays

There are several ways to create arrays in MoonBit:

```
1
    test "array creation" {
      let arr1 = [1, 2, 3]
5
      inspect(arr1, content="[1, 2, 3]")
6
7
8
      let arr2 = Array::makei(3, i => i * 2)
9
      inspect(arr2, content="[0, 2, 4]")
10
11
      let arr3 = Array::from_iter("hello" iter())
12
13
      inspect(arr3, content="['h', 'e', 'l', 'l', 'o']")
14
```

Array Operations

Common array operations include mapping, filtering, and folding:

```
1
    test "array operations" {
      let nums = [1, 2, 3, 4, 5]
5
      let neg_evens = nums filter_map(x => if x % 2 == 0 { Some(-x) } else {
6
7
      inspect(neg_evens, content="[-2, -4]")
8
9
10
      let sum = nums fold(init=0, (acc, x) => acc + x)
11
      inspect(sum, content="15")
12
13
      let last = nums last()
14
15
      inspect(last, content="Some(5)")
16
```

Sorting

The package provides various sorting utilities:

```
1
    test "sorting" {
2
3
      let arr = [3, 1, 4, 1, 5, 9, 2, 6]
5
6
      let sorted1 = arr copy()
7
      sorted1 sort()
8
      inspect(sorted1, content="[1, 1, 2, 3, 4, 5, 6, 9]")
9
10
11
      let strs = ["aa", "b", "ccc"]
      let sorted2 = strs copy()
12
13
      sorted2 sort_by((a, b) => a length() compare(b length()))
14
      inspect(
15
        sorted2,
16
        content=(
          #|["b", "aa", "ccc"]
17
18
        ),
19
      )
20
21
22
      let pairs = [(2, "b"), (1, "a"), (3, "c")]
23
      let sorted3 = pairs copy()
24
      sorted3 sort_by_key(p => p 0)
25
      inspect(
26
        sorted3,
27
        content=(
          #|[(1, "a"), (2, "b"), (3, "c")]
28
29
        ),
30
      )
   }
31
```

Array Views

Array views provide a lightweight way to work with array slices:

```
1
2  test "array views" {
3   let arr = [1, 2, 3, 4, 5]
4   let view = arr[1:4]
5   inspect(view, content="[2, 3, 4]")
6
7
8   let doubled = view map(x => x * 2)
9   inspect(doubled, content="[4, 6, 8]")
10 }
```

Fixed Arrays

Fixed arrays provide immutable array operations:

```
1
2
    test "fixed arrays" {
      let fixed : FixedArray[_] = [1, 2, 3]
3
6
      let combined = fixed + [4, 5]
7
      inspect(combined, content="[1, 2, 3, 4, 5]")
8
9
10
      let has_two = fixed contains(2)
11
      inspect(has_two, content="true")
12
13
14
      let starts = fixed starts_with([1, 2])
15
      inspect(starts, content="true")
16
      let ends = fixed ends_with([2, 3])
17
      inspect(ends, content="true")
18
```

Utilities

Additional array utilities for common operations:

```
1
    test "utilities" {
3
4
      let words = ["hello", "world"]
      let joined = words join(" ")
6
      inspect(joined, content="hello world")
7
8
9
      let nums = [1, 2, 3, 4, 5]
10
11
12
      let shuffled = nums shuffle(rand=_ => 1)
13
      inspect(shuffled, content="[1, 3, 4, 5, 2]")
14
```
